Dear Cleveland Guardians - Baseball Operations Hiring Team,

I am applying for the Data Scientist role in your Baseball R&D group. I hold an M.S. in Statistics from Columbia University (May 2026), and turning tracking data and video into decisions is close to the work I enjoy most.

At the InnoX Academy robotics lab I built a real-time vision pipeline for an autonomous badminton-training robot: YOLOv8 player detection, pose estimation, shuttlecock tracking, and court localization at 20+ FPS, plus stereo 3D shuttlecock tracking and landing-point prediction. It was sports tracking end to end, from video to a model that predicts where the shuttle will land.

My statistics training shows up in how I test models. At Arborphy AI I designed a leakage-aware evaluation protocol with individual-disjoint splits and multi-seed runs, and it showed that an apparent gain from a more complex fusion model did not reliably beat a simpler baseline. As a Research Assistant at Columbia I ran systematic ablations and built synthetic benchmarks with known ground truth to measure how well a method recovers signal. I have also implemented Bayesian stochastic block models to infer latent neuron types from connectome data.

I also care about getting results to the people who use them. At Columbia I packaged lab research code into a documented software package with step-by-step guides for wet-lab researchers, and I have led hackathon teams through technical work and judge presentations.

I am open to relocating to Cleveland. Thank you for your consideration.

Sincerely,
Lindsey Ma
