Dear Evolver Hiring Team,

I am applying to Evolver's research scientist openings. I hold an M.S. in Statistics from Columbia University (May 2026), and your focus on quantifying information and reasoning under uncertainty is where I want to work.

Much of my work has been about what data can and cannot tell you. As a Research Assistant at Columbia's Center for Theoretical Neuroscience, I studied self-supervised denoising for two-photon calcium imaging: I characterized how training-pair construction affects component stability, built synthetic benchmarks with known ground truth, and quantified trade-offs between signal retention, temporal correlation, and reconstruction fidelity. I also implemented Bayesian stochastic block models with class-dependent and spatially informed likelihoods to infer latent neuron types from the FlyWire connectome, and identified where distance-dependent assumptions break down.

I have also built systems that decide what to look at next. At Arborphy AI I built a hierarchical multi-agent reasoning prototype with constrained iterative planning, per-step information-gain scoring, and knowledge-graph-based evidence aggregation. Separately, I designed a multi-agent system whose stages earn or lose autonomy through blind audits of sampled outputs.

I care about rigor in evaluation: at Arborphy I designed a leakage-aware protocol that showed an apparent gain from a complex fusion model did not reliably beat a simpler baseline, and in interpretability work on Qwen3 I concluded that answer withholding was too unstable for reliable causal claims.

I would be glad to bring this mix of statistical inference and system building to Evolver. Thank you for your consideration.

Sincerely,
Lindsey Ma
